

Fire Departments Lower Your Carbon Footprint

MagneGrip Inline Particulate Filter for Exhaust Removal Systems

Exhaust removal systems in firehouses capture diesel exhaust emissions and expel the contaminants through ductwork into the air outside. The MagneGrip Inline Particulate Filter is positioned in the system's ductwork to filter out the harmful carbon soot before it is released outdoors.

The Inline Particulate Filter unit is factory-assembled and ready for on-site installation. Housing is 16-gauge aluminized steel to provide superior corrosion and heat resistance for appearance and long life. The MagneGrip Inline Particulate Filter can be used with any exhaust removal system that has an exhaust fan and overhead ductwork.
