MagneGrip introduces new lifting elbow

6/27/06

MagneGrip Exhaust Extraction Systems utilize a new lifting elbow that maximizes airflow through its flexible exhaust-capture hoses. The die-stamped lifting elbow eliminates backpressure and allows exhaust emissions to pass through the hose unrestricted.

The MagneGrip hose connects to an auto-release nozzle that fits over the apparatus tailpipe. All diesel exhaust emissions are drawn through the hose and overhead ductwork and expelled outside for **100 percent source capture**. No solid pollutants or toxic gases are released into the firehouse breathing area.

With maximum-efficiency airflow, high-temperature hoses, and ambient air intake to cool exhaust emission, MagneGrip systems are engineered to easily accommodate higher temperature emissions produced by 2007-model diesel engines.

Your Total Solution for Exhaust Removal & Air Purification
